

# S3-Link Email Files Setup

Here are the steps to enable related files and recipients in Email Files UI.

1. Go to S3-Link Administration > Email Files Configuration
2. Set “Type”. Select object from dropdown whose related files you want attach in email

▼ Type ⓘ

Type

Account ▼

3. Go to the “Recipients Configuration” section. From here you can enable any child object records (user, contact and lead) as recipient of the emails. Suppose while sending files related to account record, if you want to enable all account’s contacts as recipient, you can set configuration as below. Similarly, while sending files related to the case, it will auto enable the user, contact or lead of that case as recipient if “Use Related Users as Recipients” is true.

4. Go to the “Email Template Configuration” section. Select all the Salesforce classic templates you want to enable to send files related to selected “Type”. You can also set which template to be used as default template if there are multiple email templates. FYI: It will show only those email

templates in the list which have “S3” in the email template name.
